

Aerial Photography Set

This is a good way for children to look at their local area. This can be a fun task, as they can identify certain landmarks and maybe even their own house.

One activity to do with the children could be to identify how much of the area in the picture is green to show the children the extent of deforestation that is made way for new buildings like houses and business parks. This can help fuel a discussion on the green house effect and increase of Carbon Dioxide in the air.

Search for some photos from thirty or forty years ago, or as far back as you can go, and compare these to the modern day; what similarities and differences can the children see between these images? What are the positive and negative points of any changes?

Another task the children could partake in is identifying where some renewable sources of energy could be used to help the issue of diminishing availability of fossil fuels. They can look at the positive and negative sides of the having the renewable resources and why they think members of the public may or may not agree with their ideas.
